Machine-Level Programming: Data

CSCI3240: Lecture 9 and 10

Dr. Arpan Man Sainju

Middle Tennessee State University

Today

Arrays

- One-dimensional
- Multi-dimensional (nested)
- Multi-level

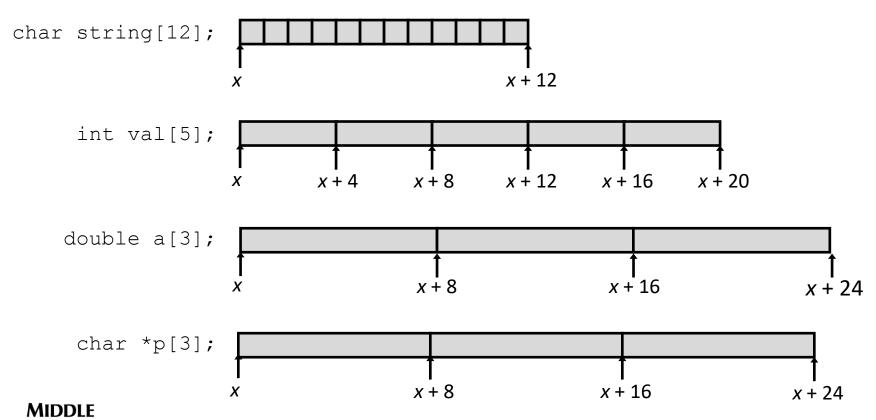

Array Allocation

Basic Principle

 $T \mathbf{A}[L];$

STATE UNIVERSITY.

- Array of data type T and length L
- Contiguously allocated region of L * sizeof (T) bytes in memory

Array Access

Basic Principle

```
T \mathbf{A}[L];
```

STATE UNIVERSITY.

- Array of data type T and length L
- Identifier A can be used as a pointer to array element 0: Type T*

int val[5];	1	5	2	1	3	
	T ·	1				1
	X X	+4 x	+ 8 x +	- 12 x +	- 16 <i>x</i> +	- 20

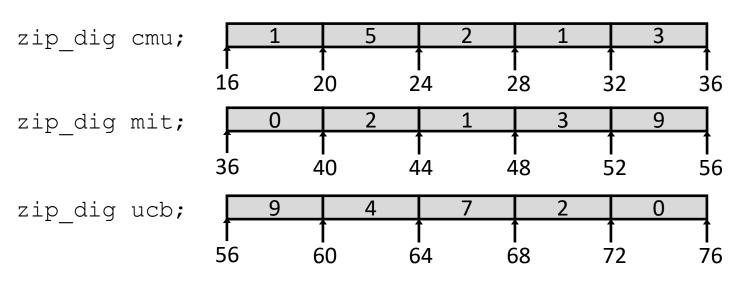

Reference	Type	Value
val[4]	int	3
val	int *	X
val+1	int *	<i>x</i> + 4
&val[2]	int *	<i>x</i> + 8
val [5]	int	??
* (val+1)	int	5
val + <i>i</i>	int *	x + 4i

Array Example

```
#define ZLEN 5
typedef int zip_dig[ZLEN];

zip_dig cmu = { 1, 5, 2, 1, 3 };
zip_dig mit = { 0, 2, 1, 3, 9 };
zip_dig ucb = { 9, 4, 7, 2, 0 };
```

- Declaration "zip_dig cmu" equivalent to "int cmu[5]"
- Example arrays were allocated in successive 20 byte blocks
 - Not guaranteed to happen in general

Array Accessing Example

```
int get_digit
  (zip_dig z, int digit)
{
  return z[digit];
}
```

X86_64

```
# %rdi = z
# %rsi = digit
movl (%rdi,%rsi,4), %eax # z[digit]
```

- Register %rdi contains starting address of array
- Register %rsi contains array index
- Desired digit at %rdi + 4*%rsi
- Use memory reference (%rdi,%rsi,4)

Array Loop Example

```
void zincr(zip_dig z) {
   size_t i;
   for (i = 0; i < ZLEN; i++)
      z[i]++;
}</pre>
```

```
# %rdi = z
 movl $0, %eax
                       \# i = 0
                        # goto middle
 jmp .L3
                        # loop:
.L4:
 addl $1, (%rdi,%rax,4) # z[i]++
                  # i++
 addq $1, %rax
                        # middle
.L3:
                        # i:4
 cmpq $4, %rax
                        # if <=, goto loop</pre>
 jbe .L4
 rep; ret
```

Multidimensional (Nested) Arrays

Declaration

- $T \mathbf{A}[R][C];$
- 2D array of data type T
- *R* rows, *C* columns
- Type T element requires K bytes

Array Size

• R * C * K bytes

Arrangement

Row-Major Ordering

A[0][0] • • • A[0][C-1]

• • • A[R-1][0] • • • A[R-1][C-1]

int A[R][C];

4*R*C Bytes

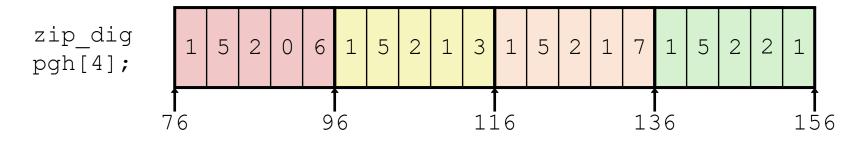

STATE UNIVERSITY.

Nested Array Example

```
#define PCOUNT 4
zip_dig pgh[PCOUNT] =
  {{1, 5, 2, 0, 6},
   {1, 5, 2, 1, 3},
   {1, 5, 2, 1, 7},
   {1, 5, 2, 2, 1 }};
```

- "zip_dig pgh[4]"equivalent to "int pgh[4][5]"
 - Variable pgh: array of 4 elements, allocated contiguously
 - Each element is an array of 5 int's, allocated contiguously
- "Row-Major" ordering of all elements in memory

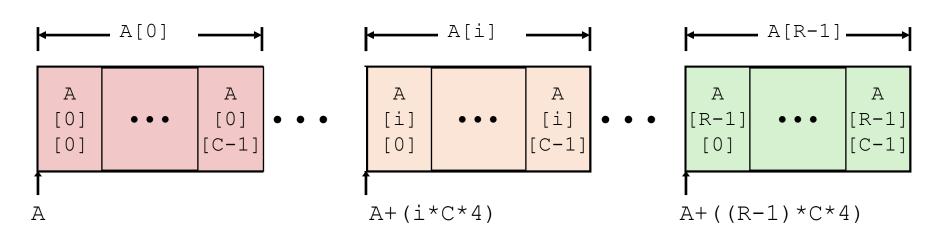

Nested Array Row Access

Row Vectors

- **A[i]** is array of *C* elements
- Each element of type *T* requires *K* bytes
- Starting address A + i * (C * K)

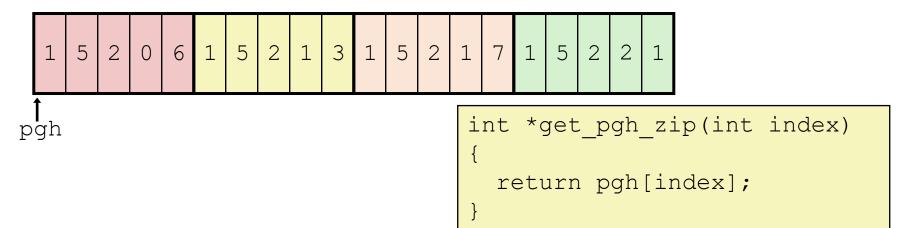

int A[R][C];

Nested Array Row Access Code

```
# %rdi = index
leaq (%rdi,%rdi,4),%rax # 5 * index
leaq pgh(,%rax,4),%rax # pgh + (20 * index)
```

Row Vector

- **pgh[index]** is array of 5 **int**'s
- Starting address pgh+20*index

Machine Code

- Computes and returns address
- Compute as pgh + 4*(index+4*index)

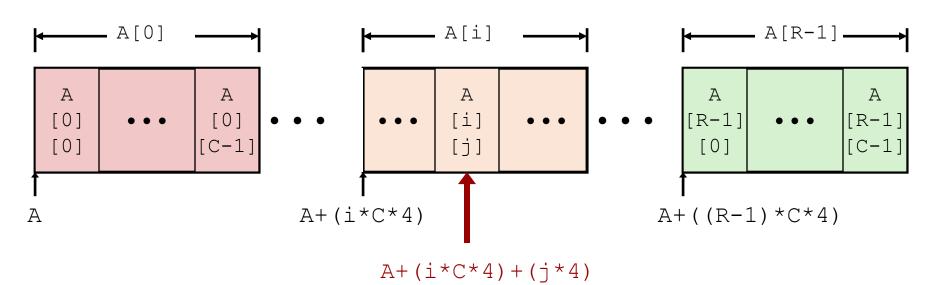

Nested Array Element Access

Array Elements

- **A**[i][j] is element of type *T*, which requires *K* bytes
- Address **A** + i * (C * K) + j * K = A + (i * C + j) * K

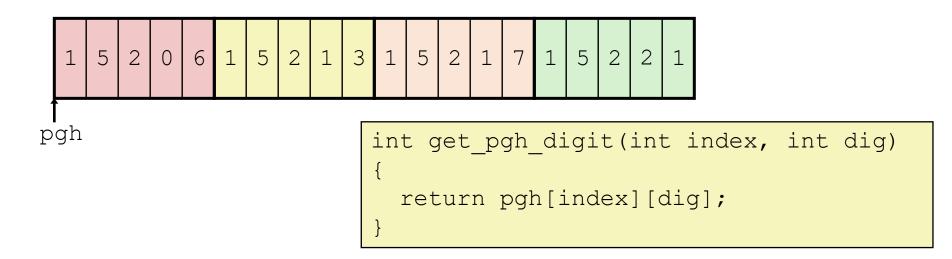

int A[R][C];

Nested Array Element Access Code

```
leaq (%rdi,%rdi,4), %rax # 5*index
addl %rax, %rsi # 5*index + dig
movl pgh(,%rsi,4), %eax # M[pgh + 4*(5*index + dig)]
```

Array Elements

- pgh[index][dig] is int
- Address: pgh + 20*index + 4*dig
 - = pgh + 4*(5*index + dig)

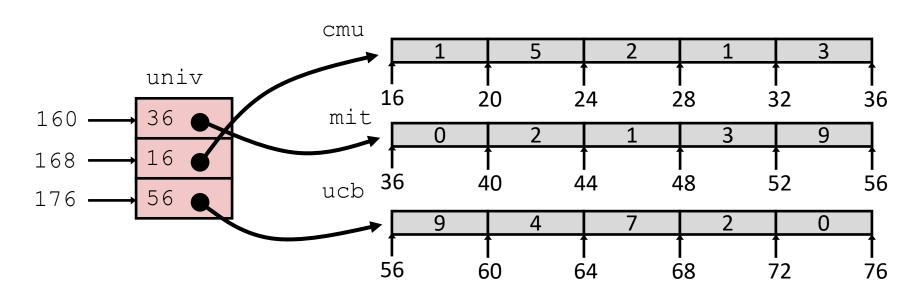

Multi-Level Array Example

```
zip_dig cmu = { 1, 5, 2, 1, 3 };
zip_dig mit = { 0, 2, 1, 3, 9 };
zip_dig ucb = { 9, 4, 7, 2, 0 };
```

```
#define UCOUNT 3
int *univ[UCOUNT] = {mit, cmu, ucb};
```

- Variable univ denotes array of 3 elements
- Each element is a pointer
 - 8 bytes
- Each pointer points to array of int's

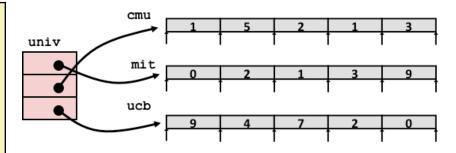

Element Access in Multi-Level Array

```
int get_univ_digit
  (size_t index, size_t digit)
{
  return univ[index][digit];
}
```

```
salq $2, %rsi # 4*digit
addq univ(,%rdi,8), %rsi # p = univ[index] + 4*digit
movl (%rsi), %eax # return *p
ret
```

Computation

- Element access Mem [Mem [univ+8*index]+4*digit]
- Must do two memory reads
 - First get pointer to row array
 - Then access element within array

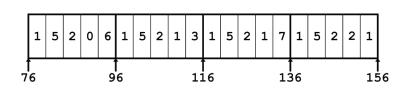

Array Element Accesses

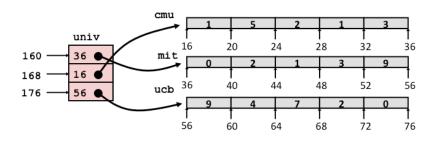

Nested array

```
int get_pgh_digit
  (size_t index, size_t digit)
{
  return pgh[index][digit];
}
```

Multi-level array

```
int get_univ_digit
  (size_t index, size_t digit)
{
  return univ[index][digit];
}
```

Accesses looks similar in C, but address computations very different:

```
Mem[pgh+20*index+4*digit]
```

Mem[Mem[univ+8*index]+4*digit]

16 X 16 Matrix Access

Array Elements

- Address **A** + i * (C * K) + j * K
- C = 16, K = 4

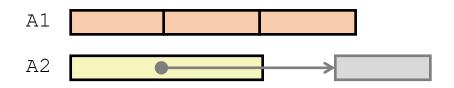

```
/* Get element a[i][j] */
int fix_ele(fix_matrix a, size_t i, size_t j) {
  return a[i][j];
}
```

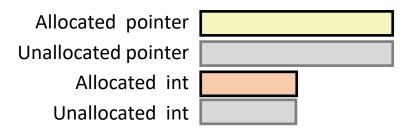

```
# a in %rdi, i in %rsi, j in %rdx
salq $6, %rsi # 64*i
addq %rsi, %rdi # a + 64*i
movl (%rdi,%rdx,4), %eax # M[a + 64*i + 4*j]
ret
```

Today

Arrays

- One-dimensional
- Multi-dimensional (nested)
- Multi-level

Structures

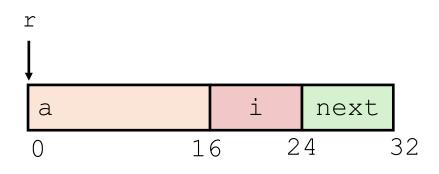

- Allocation
- Access
- Alignment

Structure Representation

```
struct rec {
   int a[4];
   size_t i;
   struct rec *next;
};
```

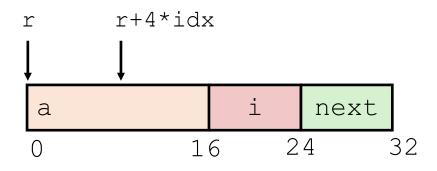

- Structure represented as block of memory
 - Big enough to hold all of the fields
- Fields ordered according to declaration
 - Even if another ordering could yield a more compact representation
- Compiler determines overall size + positions of fields
 - Machine-level program has no understanding of the structures in the source code

Generating Pointer to Structure Member

```
struct rec {
   int a[4];
   size_t i;
   struct rec *next;
};
```

Generating Pointer to Array Element

- Offset of each structure member determined at compile time
- Compute as r + 4*idx

```
int *get_ap
  (struct rec *r, size_t idx)
{
  return &r->a[idx];
}
```

```
# r in %rdi, idx in %rsi
leaq (%rdi,%rsi,4), %rax
ret
```

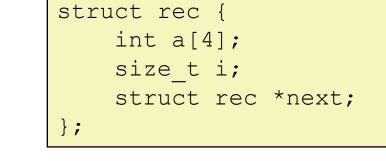

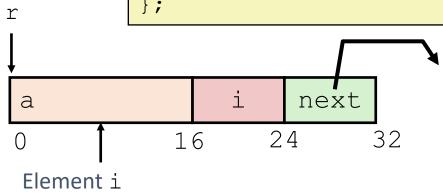

Following Linked List

C Code

```
void set_val
  (struct rec *r, int val)
{
  while (r) {
    size_t i = r->i;
    r->a[i] = val;
    r = r->next;
  }
}
```

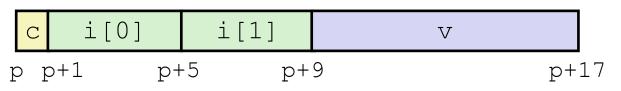

Register	Value
%rdi	r
%rsi	val

STATE UNIVERSITY.

Structures & Alignment

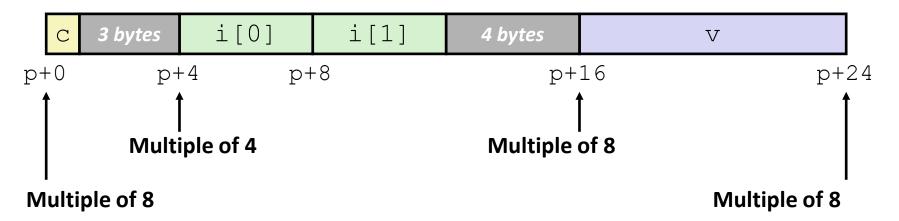

Unaligned Data

```
struct S1 {
  char c;
  int i[2];
  double v;
} *p;
```

Aligned Data

- Primitive data type requires K bytes
- Address must be multiple of K

Alignment Principles

Aligned Data

- Primitive data type requires K bytes
- Address must be multiple of K
- Required on some machines; advised on x86-64

Motivation for Aligning Data

- Memory accessed by (aligned) chunks of 4 or 8 bytes (system dependent)
 - Inefficient to load or store datum that spans quad word boundaries
 - Remember Low-order Memory Interleaving (LOI)

Compiler

Inserts gaps in structure to ensure correct alignment of fields

Specific Cases of Alignment (x86-64)

- 1 byte: char, ...
 - no restrictions on address
- 2 bytes: short, ...
 - lowest 1 bit of address must be 0₂
- 4 bytes: int, float, ...
 - lowest 2 bits of address must be 00₂
- 8 bytes: double, long, char *, ...
 - lowest 3 bits of address must be 000₂
- 16 bytes: long double (GCC on Linux)
 - lowest 4 bits of address must be 00002

Satisfying Alignment with Structures

Within structure:

Must satisfy each element's alignment requirement

Overall structure placement

- Each structure has alignment requirement K
 - **K** = Largest alignment of any element
- Initial address & structure length must be multiples of K

Example:

• K = 8, due to **double** element

```
    C
    3 bytes
    i [0]
    i [1]
    4 bytes
    V

    p+0
    p+4
    p+8
    p+16
    p+24

    Multiple of 4
    Multiple of 8
    Multiple of 8

Multiple of 8
```

struct S1 {

char c;

*p;

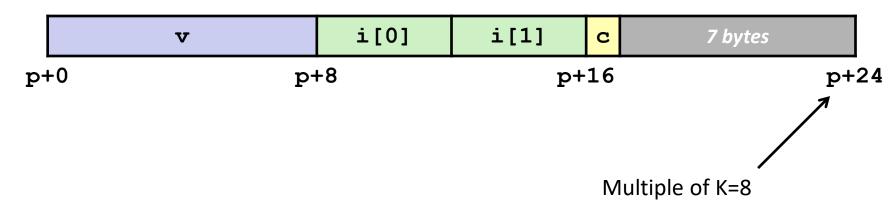

int i[2];

double v;

Meeting Overall Alignment Requirement

- For largest alignment requirement K
- Overall structure must be multiple of K

```
struct S2 {
  double v;
  int i[2];
  char c;
} *p;
```

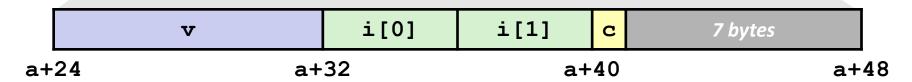

Arrays of Structures

- Overall structure length multiple of K
- Satisfy alignment requirement for every element

```
struct S2 {
  double v;
  int i[2];
  char c;
} a[10];
```

Accessing Array Elements

- Compute array offset 12*idx
 - sizeof (S3), including alignment spacers
- Element j is at offset 8 within structure
- Assembler gives offset a+8
 - Resolved during linking

```
short get_j(int idx)
{
  return a[idx].j;
}
```

```
# %rdi = idx
leaq (%rdi,%rdi,2),%rax # 3*idx
movzwl a+8(,%rax,4),%eax
```

struct S3 {

short i;

float v;

short j;

a[10];

Saving Space

Put large data types first

```
struct S4 {
  char c;
  int i;
  char d;
} *p;
struct S5 {
  int i;
  char c;
  char d;
} *p;
```

Effect (K=4)

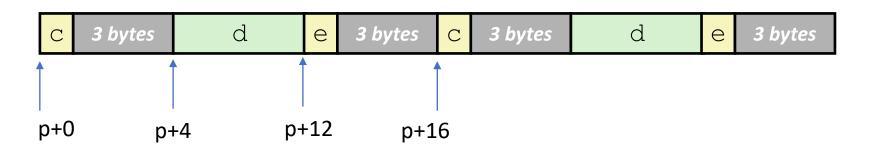

```
c 3 bytes i d 3 bytes
```

Exercise 1

```
struct S1 {
  char c;
  double d;
  char e;
} p[10];
```

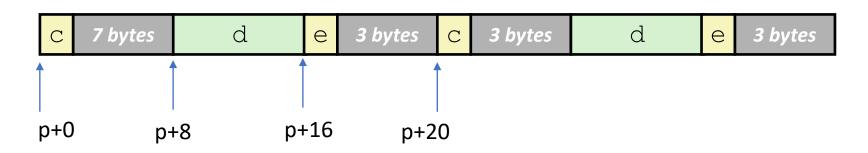

Is this allocation valid?

Exercise2

```
struct S2 {
  char c;
  double d;
  char *e;
} p[10];
```

Is this allocation valid?

Exercise 3

```
struct S2 {
  char a;
  double b;
  int c[5];
  char *d;
  int e;
  int *f;
  char g[3];
} foo;
```

Rearrange the elements of foo to conserve the most space in memory.

Summary

Arrays

- Elements packed into contiguous region of memory
- Use index arithmetic to locate individual elements

Structures

- Elements packed into single region of memory
- Access using offsets determined by compiler
- Possible require internal and external padding to ensure alignment
