CSCI3240 Exam 2 Study Guide Answers

Chapter 3 Practice problem.

(Problem 1-10 are practice problem in the book. You can find the answers in the book)

- 1. Practice problem 3.10
- 2. Practice problem 3.11
- 3. Practice problem 3.18
- 4. Practice problem 3.20
- 5. Practice problem 3.24
- 6. Practice problem 3.26
- 7. Practice problem 3.36
- 8. Practice problem 3.38
- 9. Practice problem 3.41 (A and B)
- 10. **Struct Alignment:** Consider the following C struct declaration:

```
typedef struct {
    char a;
    long b;
    float c;
    char d[3];
    int *e;
    short *f;
    } foo;
```

a) Show how foo would be allocated in memory on an x86-64 Linux system. Label the bytes with the names of the various fields and clearly mark the end of the struct. Use an X to denote space that is allocated in the struct as padding. (Each cell represents 1-byte location).

0x0	а	X	X	Х	X	Χ	X	X	b	b	b	b	b	b	b	b
0x10	С	С	С	С	d	d	d	Χ	Э	ө	a	ө	е	ө	е	е
0x20	f	f	f	f	f	f	f	f								
0x30																

b) Rearrange the elements of foo to conserve the most space in memory. Label the bytes with the names of the various fields and clearly mark the end of the struct. Use an X to denote space that is allocated in the struct as padding. (Each cell represents 1-byte location).

0x0	f	f	f	f	f	f	f	f	b	b	b	b	b	b	b	b
0x10	е	е	е	е	е	е	е	е	С	С	С	С	d	d	d	а
0x20																
0x30																

11. **Struct Access:** Consider the following C structure declaration:

```
struct my_struct{
    char a;
    long b;
    short c;
    float *d[2];
    unsigned char e[3];
    float f;
};
```

a) Show how my_struct would be allocated in memory on an x86-64 Linux system. Label the bytes with the names of the various fields and clearly mark the end of the struct. Use an X to denote space that is allocated in the struct as padding. (Each cell represents 1-byte location).

0x0	а	Χ	Χ	Χ	Χ	Χ	Χ	Χ	b	b	b	b	b	b	b	b
0x10	С	С	Χ	Χ	Χ	Χ	Χ	Χ	d[0]							
0x20	d[1]	e[0]	e[1]	e[2]	Χ	f	f	f	f							
0x30																

- b) How many bytes is the smallest possible struct containing the same elements as my_struct?
 - → Most compact ordering is 40 bytes. for example: b, d, f, e, a, c

12. Pointers and Array

Declaration	An				*An		**An			
	Cmp	Bad	Size	Cmp	Bad	Size	Cmp	Bad	Size	
int A1[3]	Y	N	12	Y	N	4	N	-	-	
int *A2[3]	Y	N	24	Y	N	8	Y	Y	4	
int (*A3)[3]	Y	N	8	Y	Y	12	Y	Y	4	
int (*A4[3])	Y	N	24	Y	N	8	Y	Y	4	

Declaration	An			*An				**An		***An		
	Cmp	Bad	Size	Cmp	Bad	Size	Cmp	Bad	Size	Cmp	Bad	Size
int A1[3][5]	Y	N	60	Y	N	20	Y	N	4	N	-	-
int *A2[3][5]	Y	N	120	Y	N	40	Y	N	8	Y	Y	4
int (*A3)[3][5]	Y	N	8	Y	Y	60	Y	Y	20	Y	Y	4
int *(A4[3][5])	Y	N	120	Y	N	40	Y	N	8	Y	Y	4
int (*A5[3])[5]	Y	N	24	Y	N	8	Y	Y	20	Y	Y	4

■ Cmp: Compiles (Y/N)

Bad: Possible bad pointer reference (Y/N)

■ Size: Value returned by sizeof

- 13. What is the difference between virus and worm?
 - → worm can run independently, virus cannot.
- 14. Explain buffer overflow attacks. How do we avoid them?
 - → check lecture 11 slides.

Chapter 5: Optimizing Program Performance

(Problem 1-2 are practice problem in the book. You can find answers in the book.)

1. Practice Problem 5.2

- 2. Practice Problem 5.3
- 3. What are the generally useful optimization techniques in C?
- 4. Why is Loop Unrolling technique effective?
- 5. Discuss two optimization blockers.
- 6. Write the optimized versions of the following C codes:

a.

```
void myfunction(double *a, double *b, long i, long n) {
    long j;
    for (j = 0; j < n; j++)
        a[n*i+j] = b[i];
}</pre>
```

Solution:

```
void myfunction(double *a, double *b, long i, long n) {
    long j;
    double bi = b[i]
    for (j = 0; j < n; j++)
        a[n*i+j] = bi;
}</pre>
```

b.
for (int i = 0; i < n; i++) {
 int ni = n*i;
 for (j = 0; j < n; j++)
 a[ni + j] = b[2];
}</pre>

Solution:

```
for (int i = 0; i < n; i++) {
  int ni = n*i;
  int b2 = b[2];
  for (j = 0; j < n; j++)
    a[ni + j] = b2;</pre>
```

```
void myFunction (int *a) {
  for (int i=0; i < getLength(a); i++) {
    a[i] = i + myfunction2(a[0]);
}</pre>
```

Solution:

```
void myFunction (int *a) {
int length = getLength(a);
int value = myfunction2(a[0]);
for (int i=0; i< length; i++) {
    a[i] = i + value;
}
//note: you can further optimize using loop unrolling</pre>
```

Chapter 12: Practice Problems

- 1. What are the possible output sequences from the following program:
- A. Circle the possible output sequences:
 - abc
 - acb
 - bac
 - bca
 - cab
 - cba

```
int main() {
    if (fork() == 0) {
        printf("a");
        exit(0);
    }
    else {
        printf("b");
        waitpid(-1, NULL, 0);
    }
    printf("c");
    exit(0);
}
```

2. Consider the following code sample.

```
int global_x = 0;
int main(int argc, char *argv[]){
    global_x = 17;
    /* Assume fork never fails */
    if(!fork()) {
        global_x++;
        printf("Child: %d\n", global_x);
    }
    else {
        wait(NULL);
        global_x--;
        printf("Parent: %d\n",
    global_x);
    }
    return 0;
}
```

A. What is printed by this program?

Child: 18 Parent: 16

B. How might the output change if we remove the call to wait?

The parent line might come before the child line. The value would stay the same, 3. Using the following code, fill each entry in the table with "Yes" or "No". Note: header removed to save space.

```
int g = 0;
// The function to be executed by all threads
void *myThreadFun(void *vargp) {
   int *myid = (int *)vargp;
   static int s = 0;
   ++s; ++g;
   printf("Thread ID: %d, Static: %d, Global: %d\n", *myid, ++s, ++g);
}
int main(){
   int i;
   pthread_t tid;
   for (i = 0; i < 3; i++)
       pthread create(&tid, NULL, myThreadFun, (void *)&i);
   pthread_exit(NULL);
   return 0;
}
```

Variable instance	Reference by	Referenced by	Referenced by	Referenced by
	main thread?	peer thread	peer thread	peer thread
		0?	1?	2?
g	No	Yes	400	Yes
S	No	Yes	Yes	Yes
i.m	Yes	Yes	Yes	Yes
tid.m	Yes	No	No	No
myid.p0	No	405	No	No
myid.p1	No	No	Yes	No
myid.p2	$N_{\mathcal{D}}$	No	No	Yes

tid.m implies local variable declared in main function.

myid.p0 implies myid local variable declared in stack of peer thread 0 myid.p1 implies myid local variable declared in stack of peer thread 1 myid.p2 implies myid local variable declared in stack of peer thread 2

4. Consider the C program below. For space reasons, we are not checking error return codes, so assume that all functions return normally.

```
int main () {
    if (fork() == 0) {
        if (fork() == 0) {
            printf("9");
        exit(1);
    }
    else
    printf("5");
}
else {
    pid_t pid;
    if ((pid = wait(NULL)) > 0) {
        printf("3");
    }
    printf("0");
    return 0;
}
```

Circle the string that can be a possible output of the program.

93050

53090

50930

39500

59300

5. Consider the C program below. For space reasons, we are not checking error return codes, so assume that all functions return normally.

```
What are the outputs?

Parent: i = 10

Child: i = 20
```

```
int i = 0;
 int main () {
    int j;
    pid t pid;
    if ((pid = fork()) == 0) {
       for (j = 0; j < 20; j++)
          i++;
       }
else {
       wait(NULL);
(hem cycri = -1; a Fo-5%) naml 23
   and were that En
    if (i < 0)
       i = 10;
    if (pid > 0)
       printf("Parent: i = %d\n", i);
    else
       printf("Child: i = %d\n", i);
    exit(0);
 }
```

- 6. Define the following terms:
 - a. deadlock
 - b. race condition
 - c. starvation
- 7. Which of the following is true about races?
 - (a) A race occurs when correctness of the program depends on one thread reaching point "a" before another thread reaches point "b".
 - (b) Exclusive access to all shared resources eliminates race conditions.
 - (c) Race conditions are the same as deadlocks.
 - (d) All race conditions occur inside loops, since that is the only way we can interleave processes

Chapter 11: Practice Problems

- 8. Explain the difference between client and the server. Provide examples of some well known servers.
- 9. What is LAN?
- 10. What does an internet protocol do?
- 11. Convert the following 32-bit addresses into dotted decimal notation:
 - a. 0xff3240ff -> 255,50,64,255
 - b. $0x00ff1234 \rightarrow 0.255$, 18.54
- 12. Convert the following addresses in dotted decimal notion to 32-bit hex form.
 - a. 129.184.254.200 → Ox 8168fec8
 - b. 253.183.199.130 Oxtd 57 (782
- 13. Explain Domain Name System. Why is it used?
- 14. Explain Socket Interface. What are the functions involved in the client and the server side? Briefly describe the job of each function.
